

What is DISCOVERY AT SCALE?

Multiplying the rate of biomarker discovery to maximize drug development success

A drug candidate with an associated biomarker is 2–10x more likely to obtain FDA approval.¹

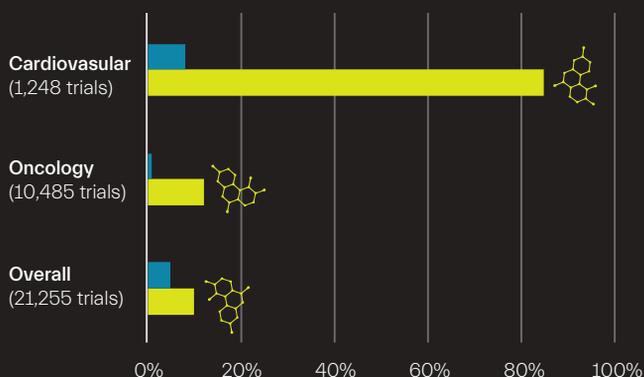

Biomarkers help to stratify patient populations by elucidating the involvement of specific genes, proteins, and molecular alterations that give rise to their disease state. Therapies can then be aligned with patients most likely to benefit.

Bioanalytical methods have been limited in their ability to probe this biology at a speed and scale that yields rapid impact, particularly when it comes to small molecule biomarker discovery – until now.

Comparison of FDA Drug Approval Rates¹

Probability of Success

- without biomarker

Sapient Biomarker Discovery Platform

rLC-MS Profiling:

Rapid discovery with untargeted, ultra high throughput analysis

Sapient's next generation rapid liquid chromatography-mass spectrometry (rLC-MS) systems capture and measure thousands of small molecule biomarkers, including uncharacterized compounds, in any biological sample.

Biocomputational Prioritization:

Identify key biomarkers in your biosamples

Leveraging biostatistical analysis and advanced algorithms, Sapient's data scientists can rapidly pinpoint sensitive and specific biomarkers of biological processes, disease progression, and/or drug responsiveness. This comprehensive analysis integrates high-dimensional data from:

THE VALUE OF SMALL MOLECULE BIOMARKERS

Produced by interactions between genes, transcripts, and proteins, internal organs and the microbiome, as well as external factors such as diet and environmental exposures, small molecule biomarkers are uniquely suited to depict phenotype.

- Non-invasively captured:** small molecules pass from local tissues into central circulation
- Give early insight into disease mechanisms:** reflect biological processes occurring in real time across systems
- Provide insight into human biology:** capture direct biomarkers of target engagement, indirect biomarkers of biological effects, and thousands of markers about the host which may influence overall drug responsiveness

Discover more to amplify the scale of your drug pipeline's success

Drug development shouldn't take more than a decade and over a billion dollars, and still fail greater than 80% of time. **Biomarker-driven drug development can shift this paradigm.**

Earlier diagnosis and intervention, optimized patient selection, smaller clinical trials, precise dosing and timing of treatments: all of this is possible with the right biomarkers. Sapient is here to help you find them faster, and accelerate the transformation of your pipeline's cost, efficiency, and value.

Human Biology Database:

Rapid validation with population-level biomarker insights

Sapient has built an expansive proprietary repository of data from hundreds of thousands of biosamples from individuals around the world – all of which have been assayed via our rLC-MS systems. Cohorts include:

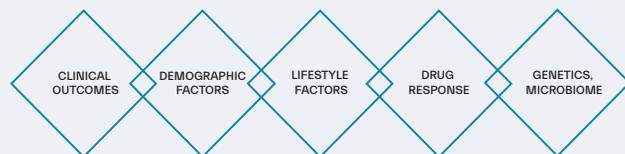

This biomarker has **already** been measured in the samples in our database!

Database Validation:

Analyze the *same* biomarker in >100,000s biosamples

Sapient's longitudinal Human Biology Database can be readily tapped to confirm the biomarker findings in a large-scale, population-based cohort, providing the statistical power to validate the specificity and sensitivity of your biomarker. Sample data is also linked to data on individuals':

Individuals in our database have been clinically followed for **>10-30 years**

Clinical Laboratory Improvements Amedments

Does the biomarker hold diagnostic promise?

Sapient's CLIA lab can support translation of your biomarker into a targeted, quantitative CLIA assay.

By discovering biomarkers of biological processes, disease progression, and drug responsiveness, we can identify the:

RIGHT DISEASE
Elucidate targets, detect disease early, predict progression

RIGHT PATIENT
Stratify patients, enrich clinical trials

RIGHT PHARMACOLOGY
Confirm target engagement, optimize dosing
